Measuring Teacher Attrition with Labour Force Survey Data

The Case of the United States

José Elías Durán Roa José Manuel Torres

Directorate for Education and Skills

Why this project?

Motivation

- Understand why teachers leave the profession.
- Is there a real policy margin to soften teacher shortages by retaining teachers, or bringing them back?

Problem

- Official microdata on teachers are not publicly available for many countries.
- We start with the United States: the country with the most information available.

▸ official sources

Contribution

We build one of the longest continuous measures of teacher attrition in the United States, twenty-eight consecutive years (1998–2025).

- **One source.** A single instrument and a single definition over the whole period.
- **No gaps.** Twenty-eight consecutive years against a quadrennial official benchmark.
- **Beyond the rate.** Who leaves, where they go, and what leaving pays.

0

Methodological discussion

The Current Population Survey

- The monthly household survey of the United States, run by the Census Bureau for the Bureau of Labor Statistics, and nationally representative of the civilian non-institutional population.
- We pool 28 consecutive March supplements, 1998–2025: **5.0 million** person-year records.
- Among them, **104,545** are teachers, about 3,700 per year.

unemployment | interviews | migration | identity

The March supplement (ASEC)

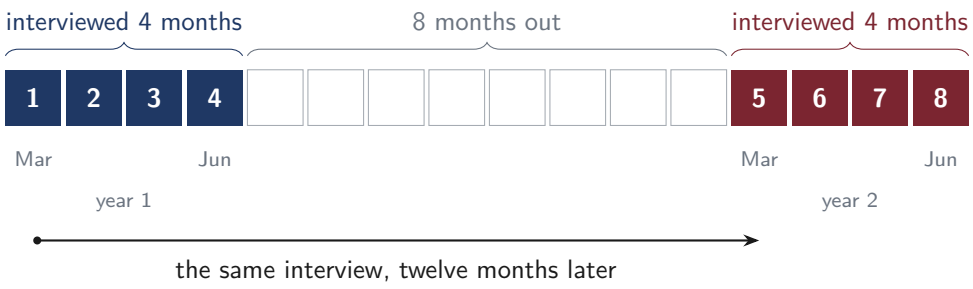

- Run by the Census Bureau each March since 1948: the source of the official annual income, poverty and health-insurance statistics.
- In a normal month the CPS interviews about 50,000 households; in March the supplement adds some 20,000 more, interviewed in February and April — about 70,000 households in all.
- Every adult reports on the previous year their longest job held, weeks worked, earnings and benefits.

Who counts as a teacher?

- The census assigns every worker a detailed occupation code for the job held longest last year. We count as a teacher anyone classified in one of the five school-teaching categories:
  - **(a)** Preschool and kindergarten teachers
  - **(b)** Elementary and middle school teachers
  - **(c)** Secondary school teachers
  - **(d)** Special education teachers
  - **(e)** Other teachers and instructors

- Our results are robust to this boundary: dropping special education teachers (d) and the residual category (e) moves the 1997–2024 average leaving rate from 8.6 to 8.7.

Two ways to identify a leaver

A. Follow the individual

All months. Links require matching:

household identifier
dwelling identifier
person line number

validated on sex, race, age +0–2

B. Ask about last year

The March supplement, retrospectively.

Leavers are the ones who taught as last year's longest job and are not teaching this March.

Disadvantages of each option

A. Following individuals

1. Individual matching errors: the sex–race–age check discards ∼5% of links; a same-profile replacement slipping through is not measurable.
2. Internal migration: ∼8% a year — the address responds but the person has moved (the Census mover rate is 8%).
3. Normal survey attrition: ∼10% a year — the address is due for re-interview but never responds again (7% in 2015, 12% in 2023).
4. Strong seasonality in teaching.
5. Many ways to define the rate (next slide).

B. Retrospective March

1. Recall bias.
2. Less sample: using only March, we observe ∼4,000 teachers a year, once each. Using all twelve months we would observe ∼11,000 teachers, three times each — but the retrospective questions that define the leaving rate are only asked in March.
3. Only March-to-March transitions; within-year spells are smoothed away.

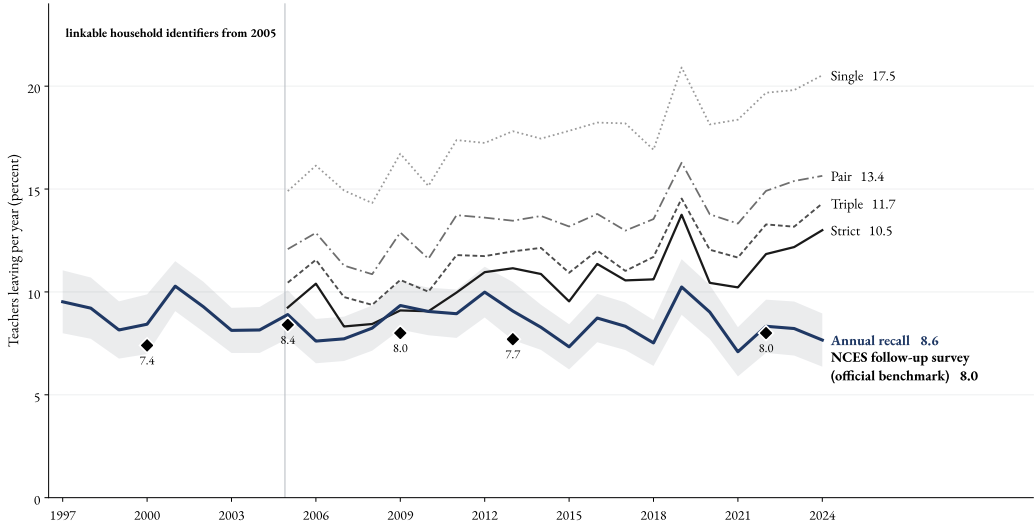

Six ways to define leaving, simplest to strictest

Unit: the individual. Four interviews in year 1, four in year 2.

	A teacher:	A leaver:
Single	seen teaching in ≥ 1 of the 4 year-1 interviews	seen teaching in none of the 4 year-2 interviews
Pair	seen teaching in ≥ 2 of the 4	seen teaching in none of the 4
Triple	seen teaching in ≥ 3 of the 4	seen teaching in none of the 4
Strict	seen teaching in all 4	seen teaching in none of the 4
Month pairs	each teaching month, on its own	not seen teaching twelve months later
Annual recall	teaching was last year's longest job	not teaching at the March interview

▸ all combinations

Leaving rates under alternative definitions

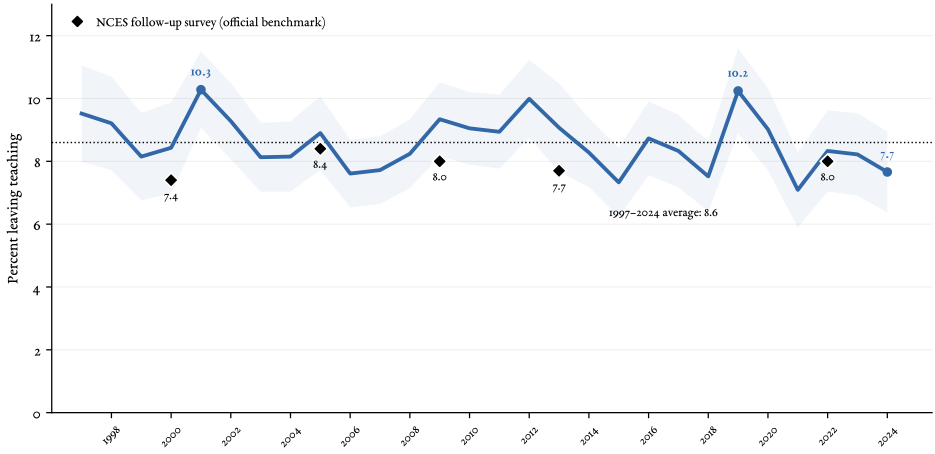

NCES: the National Center for Education Statistics; its Teacher Follow-up Survey is the official benchmark.

1

Leaving rate: how many leave

Leaving teaching, 1997–2024

Message. Around 8 of every 100 teachers leave each year, and the rate has been stable for 25 years. Attrition is a permanent flow, not a recent crisis.

▸ public vs private

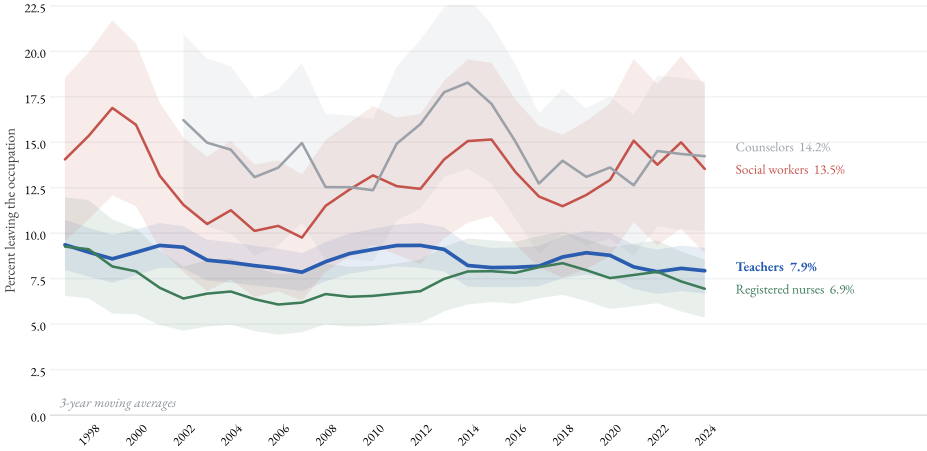

Comparable professions: who we compare teachers with

	Teachers	Nurses	Social workers	Counselors
Female (%)	76.0	88.2	82.9	76.2
Average age (years)	44.4	43.1	43.4	43.2
Master's or higher (%)	51.9	25.9	50.8	67.8
Public sector (%)	70.2	12.3	43.1	36.7
Weeks worked	46.6	49.3	49.6	48.5
Median annual wage ($)	56,000	80,000	57,000	55,000
Observations	28,932	13,107	3,407	3,962

College graduates, pooled 2015–2024, weighted; wages from 2020–2024.

Message. Teaching is similar to counseling in gender and pay, and to social work in age and education. What sets teaching apart is the public sector and the shorter work year.

Leaving the occupation, by profession

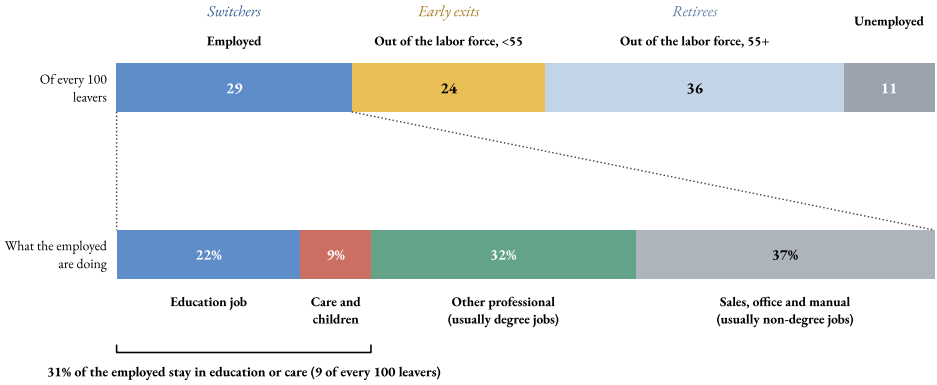

Message. Teachers leave at rates similar to or below the comparable professions. The distinctive part of teaching is who leaves and where they go, not how many.

▸ more professions

2

Composition: where they go

Of every 100 leavers (average, 2020–2024)

Message. Teachers are not being poached: 7 of every 10 leavers exit employment altogether — to retirement, home or unemployment. Only 3 in 10 trade teaching for another job.

▸ vs NCES follow-up ▸ pooled 1997–24

Where the employed leavers go

Message. More than a third of the employed leavers move to occupations where most workers hold no college degree (in red). Leaving teaching usually means leaving the profession, not moving up.

▸ proportions

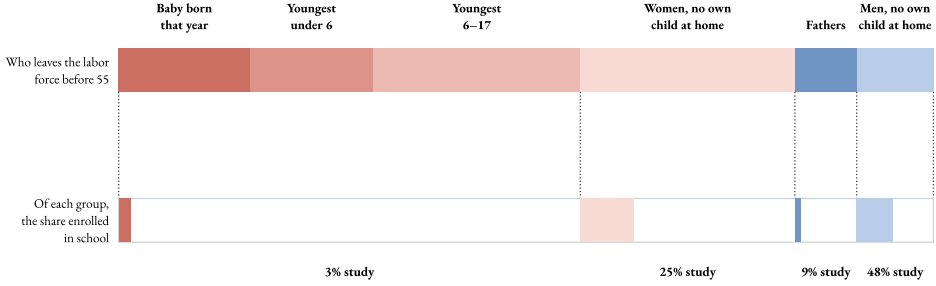

Who leaves the labor force before 55 (average, 2020–2024)

Message. Early labor-force exit is mostly a family story. More than half of this group are mothers with a child at home.

▸ pooled 1997–24

And the youngest of them leave to study

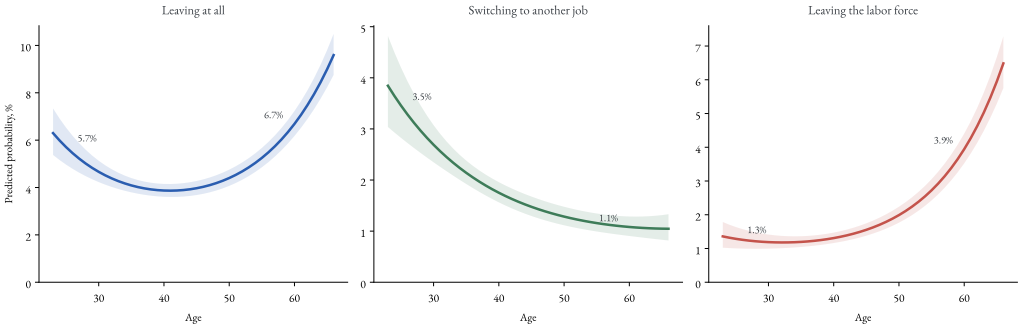

Overall, 13% of the group is studying; among those under 30, 45%.

Message. Studying is the exit of the young and the childless, not of the mothers. Among leavers under 30, almost half are enrolled in school.

What this says for policy: three margins, quantified

- **Retirees** (out of the labor force, over 55)**.** About 3% of teachers retire each year, a third of all exits. Delaying retirement is a *short-term* margin: it extends careers, it does not reintegrate anyone.
- **Switchers** (employed in another job)**.** About 2% of teachers move to another job each year, more than a third of them to jobs that do not require a degree. A real margin, but a moderate one: shortages cannot be closed through retention alone.
- **Early exits** (out of the labor force, under 55)**.** About 2% of teachers leave the labor force before 55 each year. Mostly mothers at home, for whom *flexibility* may be the missing piece; the young and childless leave to study, and need re-entry paths.

Leaving, over the life cycle

Message. Put retention efforts where they can work: the first years of the career (mentoring, stable placements). Retirements can only be planned for, not prevented.

3

Correlations: why they leave

Specification

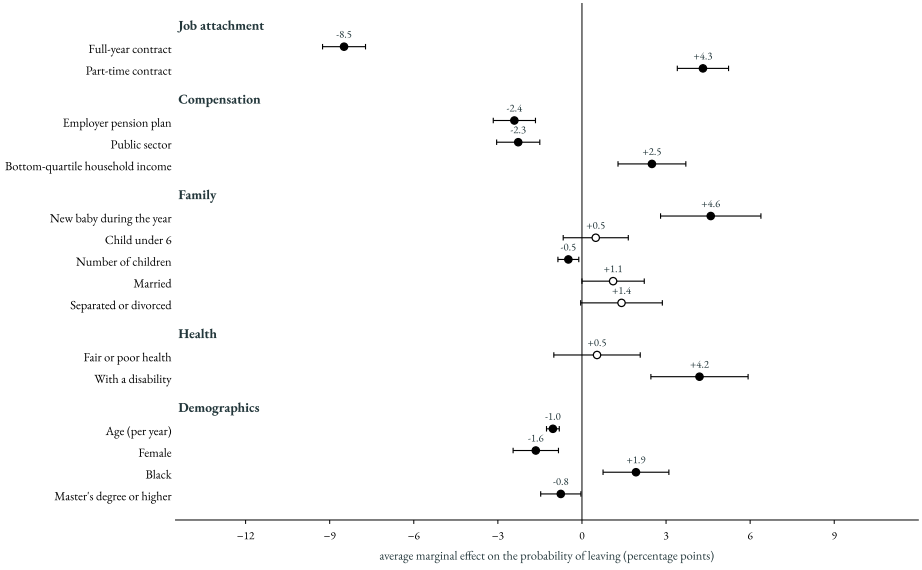

$$y_{it} = \alpha + \underbrace{\mathbf{a}'_{it}\beta_1}_{\text{job}} + \underbrace{\mathbf{c}'_{it}\beta_2}_{\text{pay}} + \underbrace{\mathbf{f}'_{it}\beta_3}_{\text{family}} + \underbrace{\mathbf{h}'_{it}\beta_4}_{\text{health}} + \underbrace{\mathbf{d}'_{it}\beta_5}_{\text{demog.}} + \delta_t + \varepsilon_{it}$$

- y_{it} teacher i left teaching in year t
- $\mathbf{a}_{it}$ job attachment: full-year contract, part-time contract
- $\mathbf{c}_{it}$ pay and security: pension plan, public sector, bottom-quartile household income
- $\mathbf{f}_{it}$ family: new baby, children, marital status
- $\mathbf{h}_{it}$ health: self-reported health, disability
- $\mathbf{d}_{it}$ demographics: age, sex, race, education
- δ_t year fixed effects (state FE variant in the appendix)

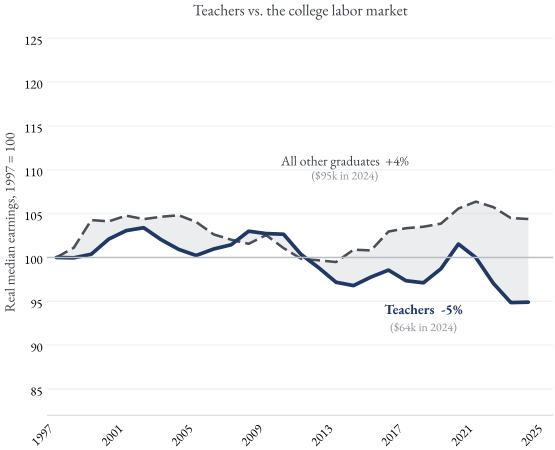

Probit, average marginal effects, robust standard errors. 2018–2024, $n = 18{,}571$.

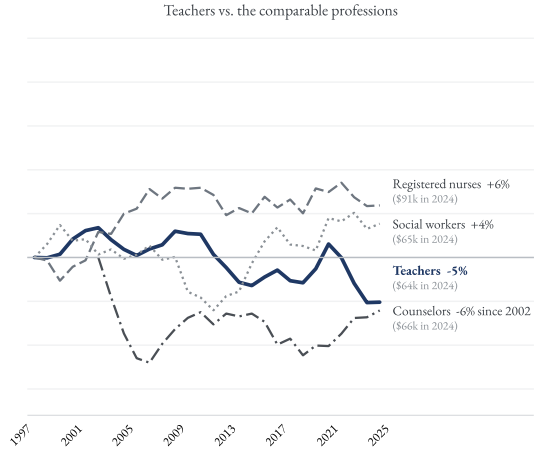

▸ LPM ▸ logit / probit ▸ bounded? ▸ what we observe

What correlates with leaving

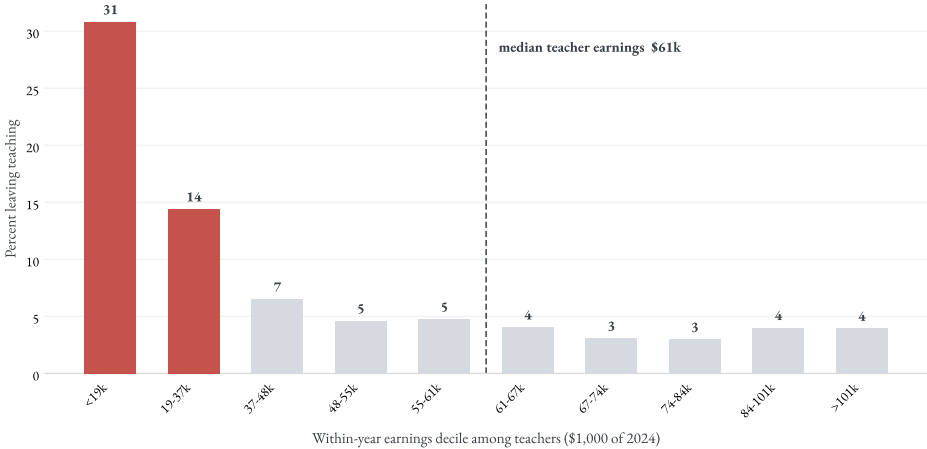

Relative pay since 1997

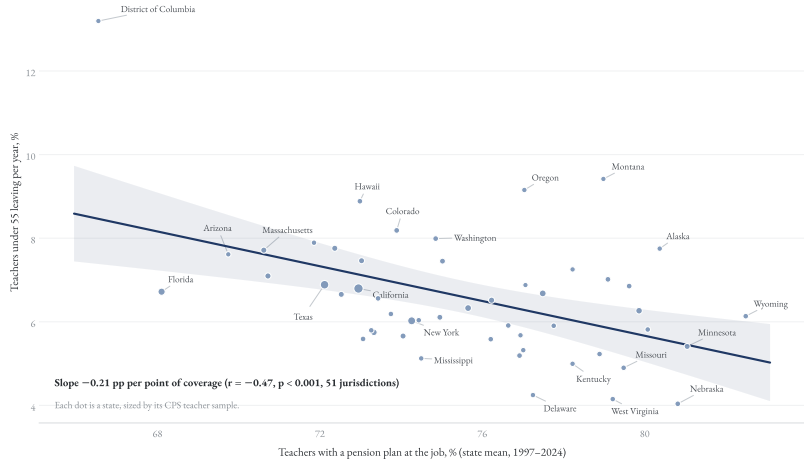

Message. Teacher pay has not grown in 25 years, and neither has it in the closest helping professions. The typical graduate now out-earns a teacher by $30,000 a year.

Leaving, by position in the teacher pay distribution

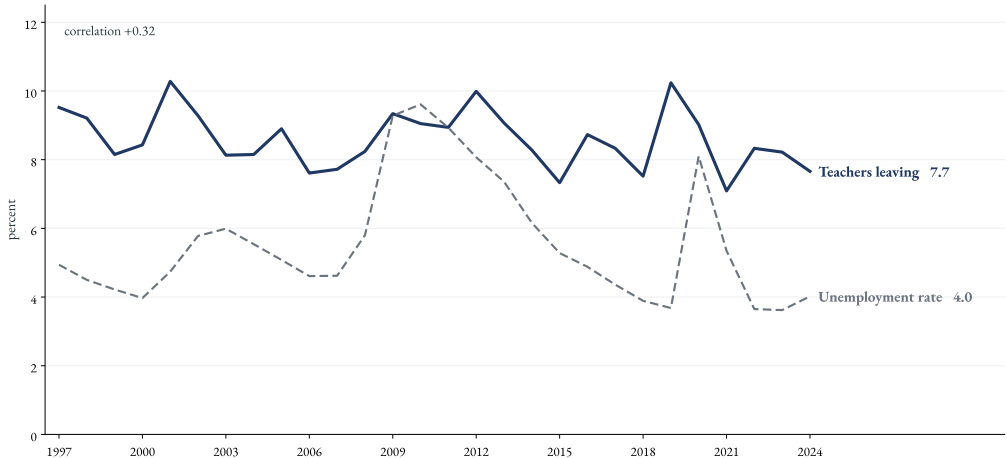

Message. Leaving is concentrated in the bottom two pay deciles, where part-year and part-time contracts live. Above the median, pay barely matters.

Pension coverage and leaving, across states

Message. States where more teachers have a pension plan lose fewer teachers before 55. Economic security retains.

Leaving and the cycle

Message. Leaving moves with the cycle. It rises when unemployment rises, so teachers are pushed out in bad times more than pulled away in good ones.

Conclusions: what we learn

- Job security is fundamental to retain a teacher, our analysis shows that a full-year contract and pension coverage are strongly correlated with a lower teacher leaving rate.
- Leaving is concentrated at the bottom of the income distribution, and those who switch jobs do not necessarily earn more afterwards. Pay, alongside working conditions, still has room as a retention lever in the US.
- The probability of leaving is highest at the start of the career, making mentoring and accompaniment a priority for retention policies.

▸ do switchers earn more?

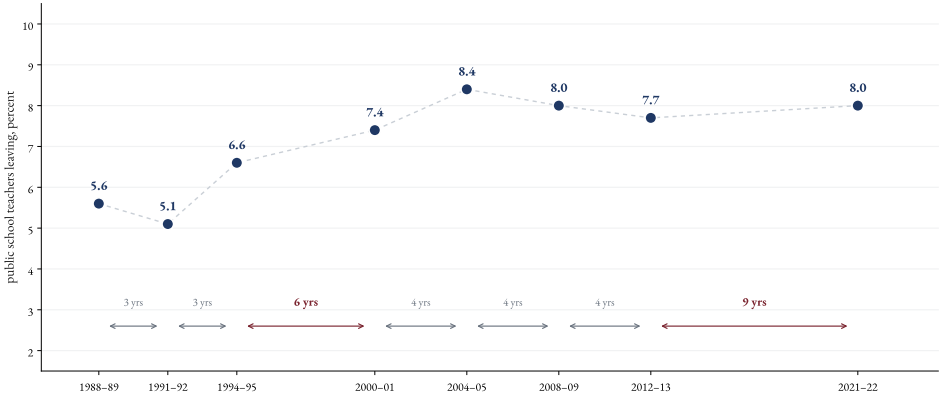

Conclusions: where the policy margins are

- **Short term.** Retirees, about 3% of teachers each year, are a pool that can cover local shortages: experienced people, with positive spillovers on the schools that re-engage them.
- **Medium term.** The young: the probability of leaving is highest at the start of the career. Mentoring and accompaniment belong where the risk is.
- **Across the board.** Economic security (full-year contracts, pension coverage) and flexibility, so that teachers who want to stay, or to return, can; insecurity should not be the reason a position is left.
- **Caveat.** We observe financial and life-cycle motives, not conditions inside schools: these are margins, not the full story.

A

Appendix

Where official numbers exist, and when

The NCES (National Center for Education Statistics) follows up a sample of teachers one year later in the Teacher Follow-up Survey: eight waves since 1988–89, published with a 2–3 year lag, and **nine years** between the last two. The OECD's *Education at a Glance* collects national rates only in its 2021, 2025 and 2026 editions, with no current figure for the United States.

back

One survey, three instruments

Instrument	What it asks	What it produces
Basic monthly interview	Labor force status in the reference week, occupation, hours	The official **monthly unemployment rate**; employment and earnings statistics
Topical supplements	School enrollment (Oct.), voting (Nov.), tobacco, computer use	Topic-specific official statistics
March supplement (ASEC)	The *previous calendar year*: longest job, weeks, income, benefits	Official **income, poverty and health-insurance** statistics, and our retrospective measure

back

Are interviews monthly? Who is new each month?

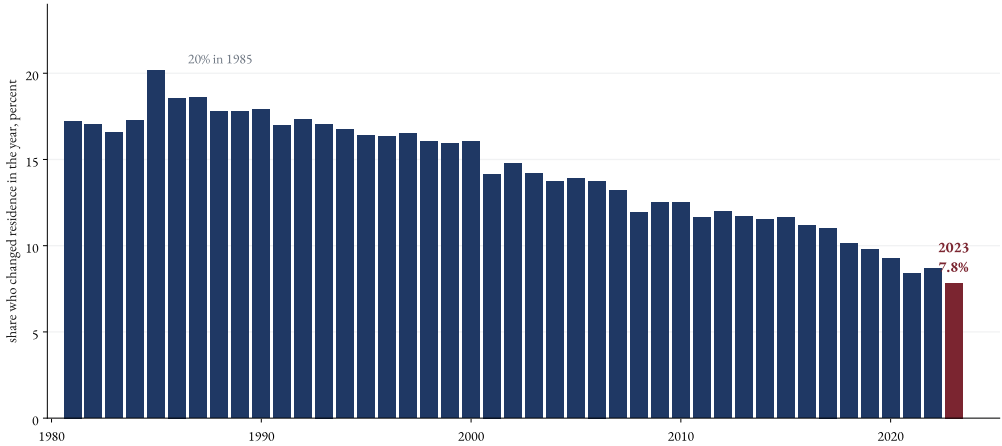

Yes: every month, one eighth of the sample sits in each position of the 4-8-4 rotation. Verified in all 251 monthly files, January 2005 to November 2025:

Month in sample	1	2	3	4	5	6	7	8
Average share (%)	12.4	12.5	12.6	12.5	12.6	12.5	12.4	12.5
Minimum (%)	10.1	11.1	11.5	11.8	12.0	12.0	11.9	12.0
Maximum (%)	13.0	13.0	13.1	13.0	14.9	13.9	13.5	13.2

So each month: $\sim$12.5% new households, $\sim$37.5% in months 2–4, $\sim$50% returning in months 5–8. Month-to-month overlap 75%; year-to-year overlap 50%, by design.

back

Internal migration in the United States

In 2023, 7.8% of Americans moved: the loss channel of any address-based panel. Census Bureau, CPS ASEC, historical table A-1.

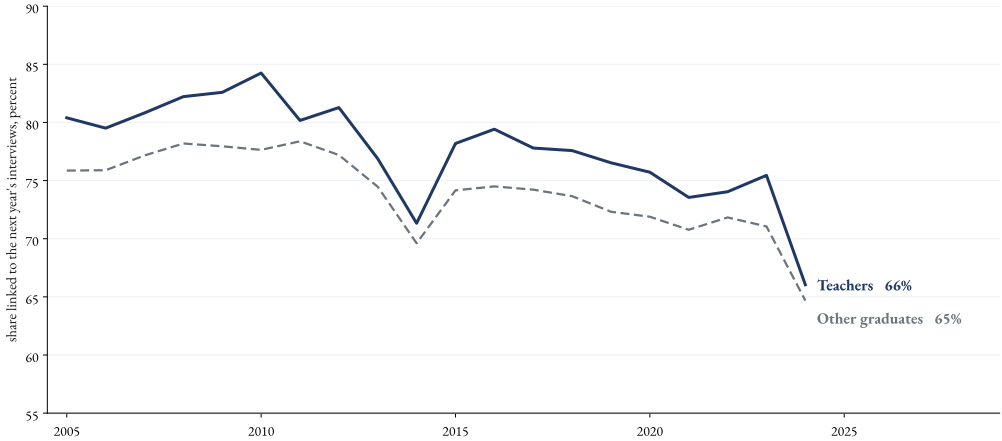

back

Is the same person validated year to year?

In the field	In the public files
Roster carried forward by the interviewer	No person identifier at all
Each member keeps a line number	Household id + dwelling id + line number reconstruct it
Occupation asked by dependent interviewing month to month	Validated on sex, race, age advancing 0–2 years
Identity is known	**Identity is inferred**: a mover replaced by someone of the same sex and similar age can slip through

back

How much is lost in linking, and who

Teachers link *more* than other graduates, not less. But movers leave teaching more, so panel measures are lower bounds on mobility-related exit.

back

Every combination of the two definitions

Who is a leaver: never seen teaching in year 2, given how much of year 2 we require to see

Who is a teacher (year-1 requirement)	observed in at least 1 interview	observed in at least 2	observed in at least 3	observed in all 4
teaching in at least 1 of 4 interviews	**18.1** n = 54,803	**17.5** n = 53,018	**17.3** n = 50,747	**17.0** n = 45,786
teaching in at least 2	**13.9** n = 49,310	**13.4** n = 47,872	**13.3** n = 45,987	**13.2** n = 41,703
teaching in at least 3	**12.0** n = 44,526	**11.7** n = 43,370	**11.6** n = 41,817	**11.5** n = 38,095
teaching in all 4	**10.8** n = 36,218	**10.5** n = 35,396	**10.4** n = 34,298	**10.4** n = 31,628

Pooled 2005–2024, weighted; a leaver is always a person never seen teaching in year 2. The rate falls steeply with the year-1 teaching requirement and barely moves with the year-2 evidence

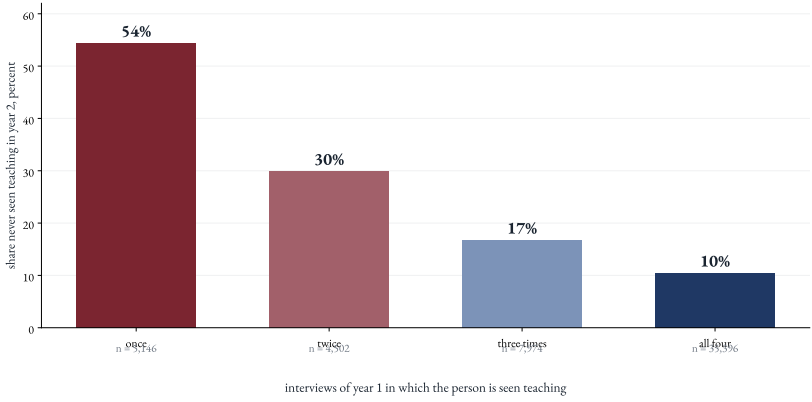

Is the linkage loss selective?

Table A4 — Is the linkage loss selective?

	Dependent variable: not observed next March (0–100)	
	LPM	Probit AME
Full-year contract	+2.40**	+2.37
	(1.07)	
Part-time contract	−0.85	−0.87
	(1.50)	
Employer pension plan	+0.41	+0.40
	(0.98)	
Public sector	−0.96	−0.96
	(1.02)	
New baby during the year	+0.33	+0.28
	(2.44)	
Number of children	+1.71***	+1.71
	(0.45)	
Youngest child under 6	−0.01	−0.03
	(1.29)	
Married	−4.03***	−4.05
	(1.37)	
Separated or divorced	−1.98	−2.10
	(1.85)	
Female	+0.77	+0.78
	(1.04)

	(2.15)	
With a disability	−0.20	−0.10
	(2.89)	
Bottom-quartile household income	+1.60	+1.65
	(1.89)	
Year fixed effects	Yes	Yes
Observations	16,208	16,208
Weighted share not observed		67.5%

Notes: College-graduate teachers aged at most 70 in the 2019–2024 ASEC. The dependent variable equals 100 when the person is not found in the following March's ASEC by the validated match (identifier, sex, race, age advancing at most two years). Coefficients are percentage points. Roughly half of the non-observations are mechanical: the 4-8-4 rotation retires about half of each March sample before the next March, independently of characteristics. Weighted least squares with ASEC supplement weights and heteroskedasticity-robust (HC1) standard errors in parentheses; a quadratic in age is included. Non-observation follows the residential-stability profile (unmarried, Black, more children) and is uncorrelated with the health, income and job variables that drive leaving. $^{*}p < 0.10$, $^{**}p < 0.05$, $^{***}p < 0.01$.

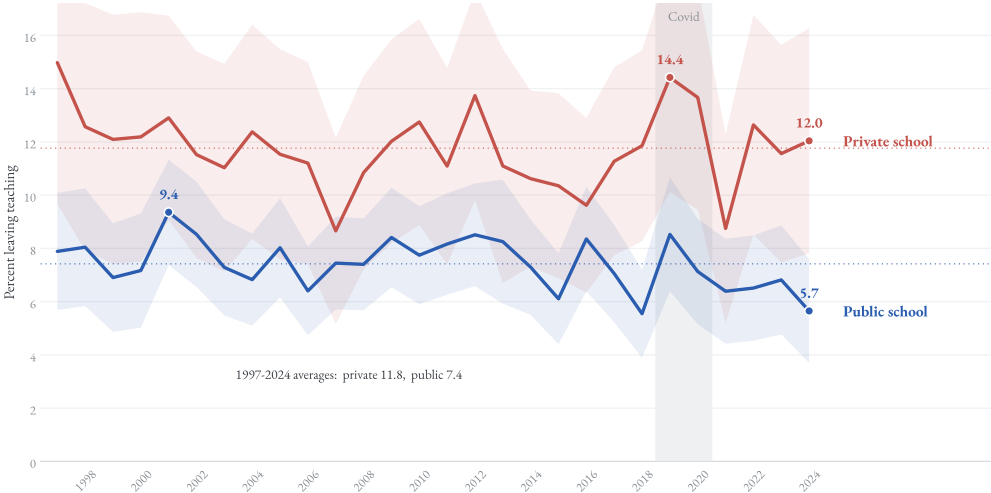

Why the rate falls as the definition tightens

How many times must we see someone teaching in year 1 before calling them a teacher? Seen once: 54% are never seen teaching in their year-2 interviews. Seen in all four: 10%. The stricter the definition, the lower the measured leaving rate. That is the whole ladder of the six definitions.

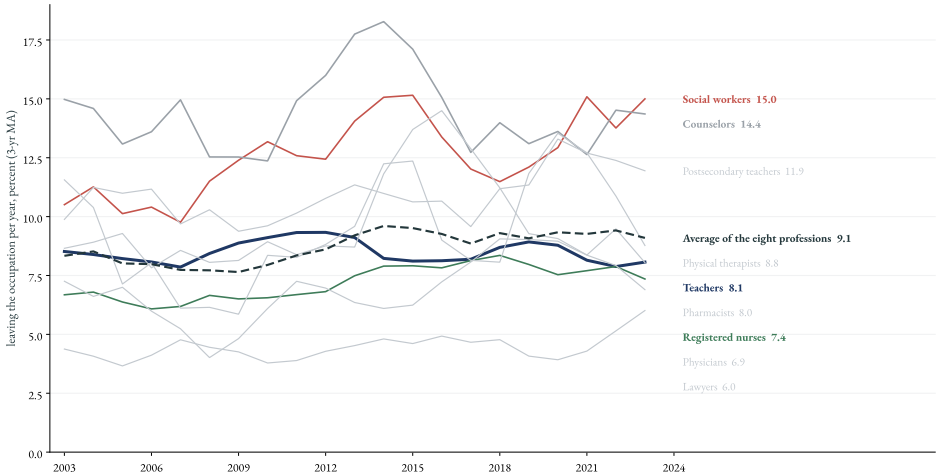

back

Public vs private schools

back

More professions, and their average

Three-year moving averages, for readability with nine professions. The main charts use the raw annual series.

Our destinations vs the NCES follow-up survey

Of every 100 leavers…	CPS 2020–24 avg.	TFS **2021–22**
Working in another job	28.8	57.2
K–12, non-teaching	–	39.3
outside education	–	11.8
Retired / out of LF, 55+	36.4	27.7
Out of the LF, under 55	23.7	10.1
Unemployed	11.1	4.8

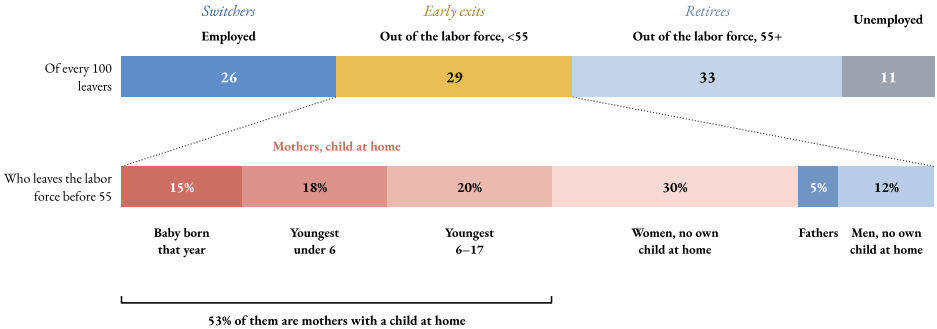

TFS: Teacher Follow-up Survey 2021–22, the follow-up of the 2020–21 NTPS. Sources: NCES 2024-039, table A-8, and NTPS estimate tables.

Why the columns differ

1. **Who counts as a teacher.** TFS follows regular classroom teachers of public schools, sampled in schools. We cover public and private, and anyone whose longest job was teaching, including part-year and part-time.
2. **What counts as working.** 39 of the TFS's 57 employed leavers hold *non-teaching K–12 jobs*: they left the classroom, not the school system. Our 28.8 means leaving the teaching occupation.
3. **Who is reachable.** A school-based sample under-represents weakly attached teachers, exactly those who exit to non-participation; a household survey catches them.
4. **The window.** Our column averages five years, 2020–2024; the TFS is the single year 2021–22.

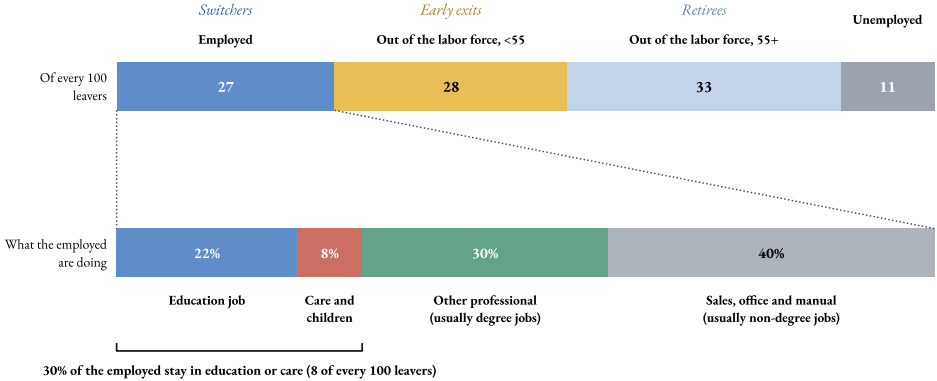

back

The same cascade, pooled 1997–2024

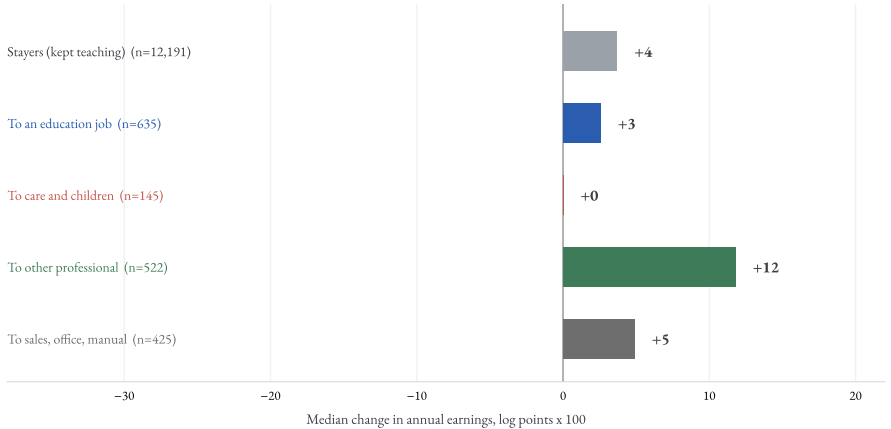

Over the whole period (6,931 leavers) the picture is the same: 29 of every 100 leavers exit the labor force before 55, and 53% of them are mothers with a child at home (15 of the 29). The five-year window is not driving the composition.

The same flow, pooled 1997–2024

Over the whole period 1997–2024 (6,866 leavers, destination groups mapped across the 1990 and 2002/2010/2018 classifications) the composition barely moves: 27 to another job, 33 retired, 28 out of the labor force before 55 and 12 unemployed; the employed split is 22 / 8 / 30 / 40. The five-year window is not driving the picture.

Do switchers earn more?

Same person observed in two consecutive March supplements. Moves into education jobs or care pay no more than staying; only the minority moving to other professional occupations clearly gains. Half of all switchers land in occupations whose median pay is below the teacher median.

back

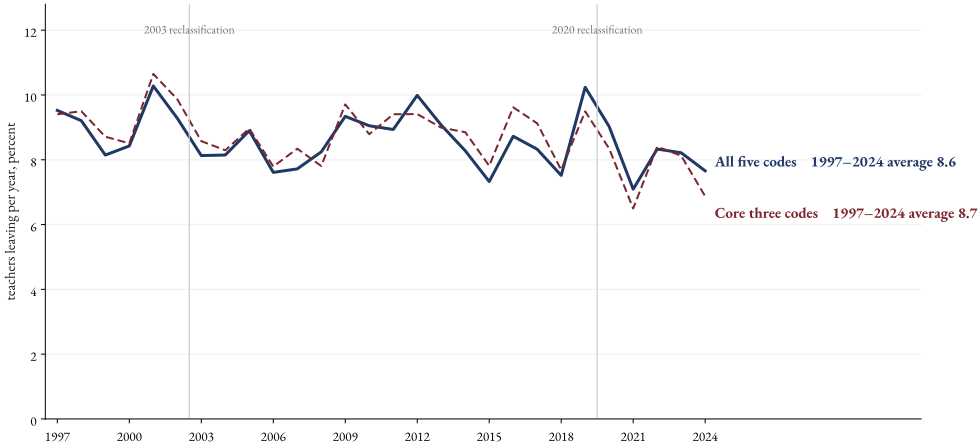

The proportions behind the destinations chart

Of every 100 employed leavers...	share
Education, non-teaching	22.6
Care	8.5
Professional and managerial	32.4
Sales, office and manual	36.5
Memo: occupations where fewer than half of US workers hold a college degree (in red)	36.3

Calendar 2020–2024; 344 employed leavers. The college-degree share of each destination occupation is computed among all employed US workers aged 25–64 in the same ASEC files, 2021–2025. 31.2 of the 36.3 red points sit in the sales, office and manual group; 5.1 in professional occupations.

back

Is the teacher group constant across code changes?

Recomputing the whole series on the three core codes moves the 1997–2024 average from 8.6 to 8.7; the 2003 and 2020 reclassifications leave no visible break.

back

Linear probability model, fixed-effects variants

Standard errors in parentheses (delta method for the logit and probit marginal effects). * $p < 0.10$, ** $p < 0.05$, *** $p < 0.01$. Column (3) is the

Is the LPM bounded between 0 and 1?

No: 22% of fitted values fall below zero. By that check, the probit is the main specification and the LPM a robustness variant.

Determinants of leaving the teaching profession

From the initial literature review of our policy paper

In the literature, but not in the CPS

- **Working conditions.** Workload, class size, and student behavior.
- **Organizational support.** Leadership, mentoring, and school climate.
- **Autonomy and intrinsic motives.** Control over one's own work and the sense of vocation.

What the CPS observes

- **Financial factors.** Own earnings, household income, and the pay of the outside options.
- **Personal life-cycle motives.** Marriage, children, health, and retirement timing.
- **Sociodemographics.** Sex, age, education, race and ethnicity, and state.
